

RAG pilot — NDA context (NeuroGig mock)

Synthetic document for NeuroGig local QA only. Not a legally binding NDA.

1. Pilot scope

Internal RAG pilot over SOPs, an incident log, and engineering drawings. No production fine-tuning without written approval; model weights stay private to the tenant.

2. Data handling

Sources: Confluence export, regulation PDFs, Jira tickets via read-only connector. PII is masked at indexing time. Request logs retained 90 days; production logs store hashes and metadata, not raw user prompts.

3. Answer boundaries

The assistant must cite a source paragraph or reply that no allowed source supports the claim. Invented clause numbers are forbidden. If two document versions conflict, the later approved revision wins.

4. Human escalation

Route to an operator when confidence is below threshold, multiple equally ranked sources appear, or the question is outside the SOP catalog. Business-hours SLA: first human touch within 15 minutes.

5. Acceptance criteria

Hold-out set of 200 questions; fraction with correct citation $\geq 85\%$. Zero false citations on blocking scenarios. p95 latency under 4 seconds at the current index size.

6. Rollout checklist

Staging sign-off from security, data owner, and product. Canary on 5% of users for one week before full enablement. Rollback playbook tested once per quarter.
